

REMARKS

Claims 1-4, 6-13 and 15-34 are pending.

Claim 1 has been rejected under 35 USC 101 as allegedly directed to non-statutory subject matter. Applicant respectfully traverses this rejection.

The system in the present invention uses a central core site and a computer storage medium that has elements through which a seller and purchaser operate.

Claim 1 contains a functional statement in the preamble that states “the computerized system for interesting and retaining at least one qualified purchaser or licensee of a patent or trade secret.” This meets the requirement of usefulness and tangibility. Further, Claim 1 has been amended to show a positive functional interrelationship between the medium and the activities recited. The medium permits the activities of a seller and a purchaser, respectfully, providing and accessing information relating to patents and trade secrets. It is now believed that the present wording is compliant with the principles of section 101. Applicant invites the Examiner to call the undersigned if an Examiner’s amendment could be made to better reflect the functionality requirement under MPEP 2106.

Claims 1-4, 6-13 and 15-34 have been rejected under 35 USC 102(b) as allegedly anticipated by Schneck, et al. Applicant respectfully traverses this rejection.

No patent or trade secret: Schneck does not anticipate the claims under 35 USC 102(b) because the data in Schneck is not a patent or trade secret. Digital music presented in Schneck is never patented or trade secret protected. It is typically copyrighted.

Product vs. information relating to patents and trade secrets:

Schneck is directed to a system for the protection of a digital data music product. In Schneck, the user is downloading the actual product itself. Schneck does not anticipate the present claims because Schneck does not relate to information disclosure of patents or trade secrets relating to a product or method, as is required by the present claims.

The levels of disclosure in the present invention are described in the specification as being a description of patents, sales presentations focusing on the benefits (but not necessarily the specifics) of the technology, with detailed text, pictures, samples or other items normally associated with an initial sales presentation. (page 13, lines 1-8), and information regarding ability to acquire and exploit technology (Fig. 2). At the end of the process, the purchaser may obtain a full disclosure of the technology (information relating to the product) (page 13) and enter into a contract relative to the patent or trade secret. These levels of disclosure are not even mentioned in Schneck.

Schneck is only directed to a system for controlling access and re-distribution of digital data such as songs. The varying levels of disclosure in Schneck are designed to protect portions of copyrighted digital data from being downloaded and pirated. An Example of a system of this nature is found on Napster, where a user can listen to a sample of a song (product) and if he likes it, he can pay for and download the whole song (product).

Intellectual property referred to in Schneck: The Examiner refers to Schneck as disclosing “intellectual property.” However, Schneck does not apply to information relating to patents and trade secrets. A careful reading of column 34, lines 29-41 reveals that the term, “intellectual property” as it is used in Schneck, is used loosely to refer to the physical **data or product and not the actual (intellectual property) patent or trade secret**. Again, copyrights are not patents or trade secrets. Schneck describes how it can help intellectual property (copyright) owners of digital data ...

“the invention offers the intellectual property (copyright) owner the opportunity to restrict access and use of his or her **data** beyond the protections that may be available in law.”

Hence, Schneck is attempting to avoid asserting copyrights in court by keeping the horse from leaving the barn in the first place, so to speak. This is important to note because it illustrates the differences between protecting the copyrighted product (Schneck) which is totally different than “information” about a patent or trade secret (the presently claimed invention).

As explained above, Schneck states that it offers protection (control of data distribution) beyond that available in law in the courts. (The horse never leaves the barn without payment). This helps us to better understand the quote:

“The mechanisms discussed herein are technical in nature and are independent of any form of legal protection –a purely technological approach has been presented to controlling access to data.” Schneck col. 34.”

It is submitted that the present invention is not anticipated by Schneck.
